Abstract Agricultural commodity price prediction is crucial for supporting farmers, traders, and policymakers in making informed decisions. This project aims to develop a machine learning model to predict the prices of key agricultural commodities such as pulses, vegetables, and cereals. Agricultural commodity price prediction is essential for enabling farmers, traders, and policymakers to make informed decisions and optimize resource allocation. This project focuses on developing a machine learning model using Convolutional Neural Networks (CNN) to predict the prices of key agricultural commodities, including pulses, vegetables, and cereals. CNNs, typically used for image processing, are applied here to capture intricate patterns and temporal dependencies in the data. By leveraging historical price data, weather conditions, and market trends, the CNN model effectively identifies complex relationships and provides accurate price forecasts. Comparative analysis with traditional regression methods demonstrates the superior performance of the CNN model in handling large, multidimensional datasets. The system is designed to be user-friendly, offering stakeholders real-time access to price predictions and valuable insights into market dynamics. This innovative approach not only helps stabilize agricultural markets but also empowers farmers to make better economic decisions, ultimately reducing financial uncertainty and promoting sustainable agricultural practices.

Keywords: Agricultural Commodity Price Prediction, Convolutional Neural Networks(CNN), Time Series Forecasting, Market Trends

1. INTRODUCTION

Price volatility in agricultural markets presents significant challenges for farmers, traders, and policymakers, impacting economic stability and strategic decision-making. Traditional forecasting methods, such as statistical models and expert assessments, often fail to capture the nonlinear and dynamic nature of commodity price fluctuations. These variations are influenced by multiple factors, including historical trends, climatic conditions, supply chain disruptions, and global market dynamics. Accurately predicting agricultural prices is crucial for optimizing production, mitigating financial risks, and ensuring food security. Conventional forecasting approaches struggle with handling large datasets, multivariate dependencies, and real-time market fluctuations. To address these limitations, this study proposes an AI-ML-based Price Prediction System leveraging Convolutional Neural Networks (CNNs) for improved accuracy in agricultural price forecasting. The model integrates diverse factors such as historical price data, weather patterns, and market trends to generate precise predictions for pulses, vegetables, and cereals. A web-based interface, developed using Python, Flask, and machine learning libraries, enables real-time access to forecasts, empowering stakeholders with data-driven insights. However, growing patient loads, limited specialist availability, and the increasing volume of medical data pose challenges for timely and accurate diagnosis. AI-based tools that can process and integrate multiple modalities offer a promising solution by augmenting

clinicians' capabilities, reducing diagnostic errors, and expediting patient care. Current AI diagnostic systems primarily focus on single modalities. NLP-driven chatbots analyze patient symptoms and medical histories expressed in text to suggest possible diagnoses or recommend further tests. For instance, symptom checkers like Babylon Health employ rule-based or machine learning models to interact conversationally with patients. Meanwhile, computer vision algorithms, powered by convolutional neural networks (CNNs), have shown remarkable success in interpreting medical images for disease detection, such as identifying pneumonia in chest X-rays or tumors in MRI scans. However, these unimodal approaches have limitations. Text-only systems may miss critical visual clues, and image-only systems lack contextual patient information. Consequently, diagnostic accuracy and reliability can suffer. Multimodal AI systems integrate information from various input sources, enhancing the depth and breadth of diagnostic analysis. By simultaneously processing patient-reported symptoms, imaging data, and laboratory values, multimodal models can uncover complex patterns and correlations that might be overlooked in unimodal analyses. For example, a suspicious shadow on a lung X-ray combined with patient history of smoking and specific respiratory symptoms provides stronger evidence for diagnosis than either data source alone. Deep learning architectures, such as transformers and fusion networks, enable effective combination of heterogeneous data, improving diagnostic confidence and interpretability. Despite its promise, developing a multimodal AI chatbot for medical diagnosis presents challenges. Ensuring data privacy and security is paramount given the sensitive nature of health information. The system must address potential biases in training data to avoid disparities in care. Interpretability of AI decisions remains a critical concern to gain trust among healthcare providers and patients. Additionally, regulatory approvals and clinical validations are necessary to ensure safety and efficacy. The platform efficiently processes large datasets while ensuring an interactive user experience through HTML, CSS, and JavaScript. By incorporating deep learning methodologies, this project enhances the reliability of agricultural price predictions, reduces uncertainty in market planning, and contributes to a more stable agri-horticultural economy. Future improvements may include integrating additional economic indicators, real-time data acquisition from external sources, and expanding support for a broader range of agricultural commodities.

2. LITERATURE SURVEY

In developing an AI-ML-based price prediction model for Agri-horticultural commodities, it is crucial to consider previous research and advancements in agricultural price forecasting, hybrid machine learning models, and deep learning techniques. This literature survey highlights key studies that provide foundational knowledge and innovative methodologies relevant to the proposed system. Accurate agricultural price prediction is essential for farmers, traders, and policymakers to make informed decisions. Traditional methods like ARIMA struggle with handling complex, multivariate, and nonlinear relationships in price fluctuations. To address these challenges, researchers have explored advanced hybrid models that integrate statistical approaches with deep learning techniques. The prediction of agricultural commodity prices has become a significant area of research, with various studies exploring the use of machine learning and deep learning techniques to improve forecasting accuracy and reliability. Traditional statistical models such as the Autoregressive Integrated Moving Average (ARIMA) have been widely used for time series forecasting. However, they have limitations in handling nonlinear relationships, multivariate data, and large datasets. To overcome these challenges, researchers have focused on integrating statistical models with deep learning algorithms and developing advanced machine learning frameworks to enhance prediction performance.

Obtaining HRV from ECG readings requires clinical settings and specialized technical knowledge for data interpretation. Thanks to the recent technological advances on the Internet of medical things (IOMT) [17], it is possible to deploy a commercially available wearable or non-wearable IOMT devices to monitor and record heart rate measurements. While the accuracy achieved with full features is nearly 100%, we have also introduced a feature reduction algorithm based on *analysis of variance (ANOVA)* F-test and demonstrate that it is possible to achieve an accuracy score of 96.5% with less than half of the features that are available in the SWELL-KW dataset. Such a feature extraction reduces the computational load during the model

training phase. Dudam and Phadke [5] made a significant contribution by leveraging Convolutional Neural Networks (CNNs) within an Android application for Indian currency detection. Their model achieved high accuracy and was designed for real-time use on smartphones, aligning well with the goals of mobile accessibility. CNN's ability to self-learn spatial hierarchies of image features made this system robust against varying lighting conditions, occlusions, and wear-and-tear in notes.

Lecun et al. [6] provided a foundational understanding of deep learning and CNNs. Their seminal paper established CNNs as a superior approach for visual recognition tasks. This has encouraged a shift in assistive technology development from traditional image processing to AI-driven systems. CNNs offer high recognition rates and adaptability to new currency designs through retraining, enhancing the sustainability of such systems. Jalab and Hamed [7] reviewed various computer vision techniques applied in currency recognition systems. Their study highlighted that while traditional algorithms like SIFT, SURF, and OCR had been effective to a degree, deep learning models showed superior performance across metrics such as speed, accuracy, and versatility. They emphasized that mobile deployment and offline operability are essential for real-world use among visually impaired users. Islam et al. [8] developed a Bangladeshi currency recognition mobile app using a similar architecture. Their model utilized region-based image analysis and machine learning algorithms. Although the geographical context differs, the challenges such as currency degradation, inconsistent lighting, and device variability were addressed in ways applicable to Indian currency as well. Their emphasis on lightweight deployment and multilingual TTS made the system particularly accessible.

Choras [9] explored feature extraction techniques that are foundational to both traditional and modern computer vision applications. His discussion on histogram-based methods, texture analysis, and shape descriptors underpins many earlier currency recognition systems. Though less effective for modern variable conditions, these techniques still hold value in preprocessing stages, such as segmentation and ROI isolation. Hinton et al. [10] emphasized the utility of mini-batch gradient descent in training deep neural networks. This learning technique is crucial for speeding up model convergence and improving generalization—benefits that directly enhance the training of CNNs for currency recognition. Incorporating these optimization strategies helps reduce model size and computation time, making deep learning viable even on resource-constrained mobile devices. From the literature reviewed, several trends emerge. Firstly, the shift from classical image processing to AI-based methods, particularly CNNs, has substantially improved recognition performance and system flexibility. Secondly, there is a growing emphasis on smartphone-based deployment, which offers cost-effectiveness and accessibility for visually impaired individuals. Thirdly, integration with text-to-speech (TTS) systems and multilingual support remains critical to making these applications truly inclusive. However, challenges still persist. Most models require substantial datasets for training, particularly for currency with varying wear conditions and under diverse environmental scenarios. Additionally, counterfeit detection, although explored by Sharma et al. [4], remains underdeveloped in real-time assistive applications. There is also a lack of comprehensive systems that can function entirely offline without compromising performance, despite partial efforts made in that direction by Islam et al. [8]. In conclusion, the current body of work demonstrates a strong foundation and progression toward intelligent, user-centric solutions for currency recognition. The most promising direction involves deep learning models deployed on mobile platforms, enhanced with localized audio output. These systems must be continually updated with newer currency notes and designed to handle real-world conditions to ensure reliability and trustworthiness for visually impaired users.

3. PROPOSED SYSTEM

The methodology adopted in this research focuses on developing an AI-ML-based price prediction model for Agri-horticultural commodities, leveraging deep learning techniques to enhance forecasting accuracy. The core of this approach is a Convolutional Neural Network (CNN) model, designed to capture complex

patterns and temporal dependencies within agricultural price data. This section outlines the data collection process, preprocessing steps, model architecture, and evaluation methods used in the study. The entire model and necessary libraries are stored locally within the mobile application, removing the dependency on internet connectivity. This makes the system highly suitable for rural or low-income users who may not have regular internet access. Furthermore, the application is designed with a **minimalistic, accessible user interface**—large buttons, haptic feedback, and voice navigation ensure that the visually impaired can operate the system independently. Security and privacy are also considered. Since the app operates offline and does not upload any image data to external servers, user data remains entirely confidential. The lightweight nature of the app (under 100MB) ensures compatibility with low-end Android devices. For robustness, the system also includes a **confidence threshold mechanism**. If the confidence score of the classification falls below a certain threshold (e.g., 80%), the app informs the user that the currency could not be identified reliably and prompts them to recapture the image. This prevents misclassification and increases user trust. In future enhancements, the app can be expanded to include **counterfeit detection** using watermark and security thread recognition, as well as **currency conversion** features for tourists and dual-language audio feedback for bilingual users. Integration with wearable technology like smart glasses or voice-controlled assistants is also a promising direction for extending usability. Overall, the proposed system presents an effective and inclusive solution for currency recognition in India, empowering visually impaired users with technological independence. By incorporating cutting-edge AI, accessible design principles, and real-world applicability, this system represents a step forward in assistive technology and digital inclusivity. The dataset used for this research comprises historical price data of key agricultural commodities, including pulses, vegetables, and cereals. The data was sourced from reliable agricultural databases, government reports, and market price monitoring systems. In addition to historical price records, external factors such as weather conditions (temperature, rainfall, humidity) and market trends were incorporated to enhance the model's predictive capabilities. These multivariate datasets provide a comprehensive view of the variables influencing commodity price fluctuations.

4. RESULT & DISCUSSION

The performance of the Convolutional Neural Network (CNN) model was thoroughly evaluated by comparing it against traditional statistical models such as the AutoRegressive Integrated Moving Average (ARIMA) and other advanced machine learning algorithms, including Long Short-Term Memory (LSTM) networks. This comparative analysis was conducted to assess the model's ability to predict agricultural commodity prices accurately while handling complex data patterns. Through this evaluation, it was observed that the CNN model exhibited superior performance in multiple aspects. Unlike ARIMA, which is constrained by its reliance on linear assumptions and stationarity of data, the CNN model effectively captured nonlinear relationships present in agricultural market trends. Additionally, when compared to LSTM, CNN demonstrated enhanced efficiency in processing multivariate data by extracting meaningful features from multiple influencing factors such as historical price trends, weather conditions, and market fluctuations. Furthermore, CNN's capability to manage large datasets more effectively contributed to its improved predictive accuracy, making it a more robust choice for forecasting agricultural prices. This advantage stems from its ability to automatically learn and extract complex patterns from vast amounts of input data, reducing the need for extensive manual feature engineering. The results of this comparative analysis validated the effectiveness of the CNN-based approach in agricultural price prediction, reinforcing its potential as a reliable tool for aiding stakeholders in making informed market decisions.

One of the critical requirements for an assistive system is responsiveness. The application was tested on a mid-range Android smartphone (4 GB RAM, Octa-core processor). The average time from image capture to audio output was approximately **1.8 seconds**, demonstrating near real-time performance suitable for everyday use.

This speed was achieved by optimizing the CNN model using TensorFlow Lite, which reduced model size without compromising accuracy. Additionally, the application's offline capability ensured that there was no latency due to network delays, which is essential for users in rural or network-scarce areas. User experience testing involved

15 visually impaired volunteers who used the app to identify currency notes in various settings, such as indoor rooms, outdoor markets, and dimly lit environments. Feedback was overwhelmingly positive regarding the ease of use, audio clarity, and the app's ability to handle diverse note conditions.

The large, voice-enabled buttons and clear voice prompts allowed users to operate the app independently without external assistance. The multilingual Text-to-Speech feature was appreciated, enabling users from different linguistic backgrounds to benefit from the system. Users reported increased confidence in handling cash transactions, reduced dependency on others, and a sense of empowerment. Despite the promising results, the system has some limitations. Misclassification issues arise when currency notes are extremely worn or heavily damaged, as critical features become unrecognizable to the model. Also, the current model does not detect counterfeit notes, which is a crucial aspect of currency validation.

Lighting conditions such as extreme glare or shadow can degrade image quality, affecting recognition accuracy. Although the preprocessing stage attempts to normalize these variations, certain conditions remain challenging. Future work should explore integrating image enhancement algorithms and infrared imaging to mitigate these issues. The application currently supports only Indian currency; thus, it is not suitable for travelers or immigrants dealing with multiple currencies. Incorporating a multi-currency recognition module could broaden its applicability.

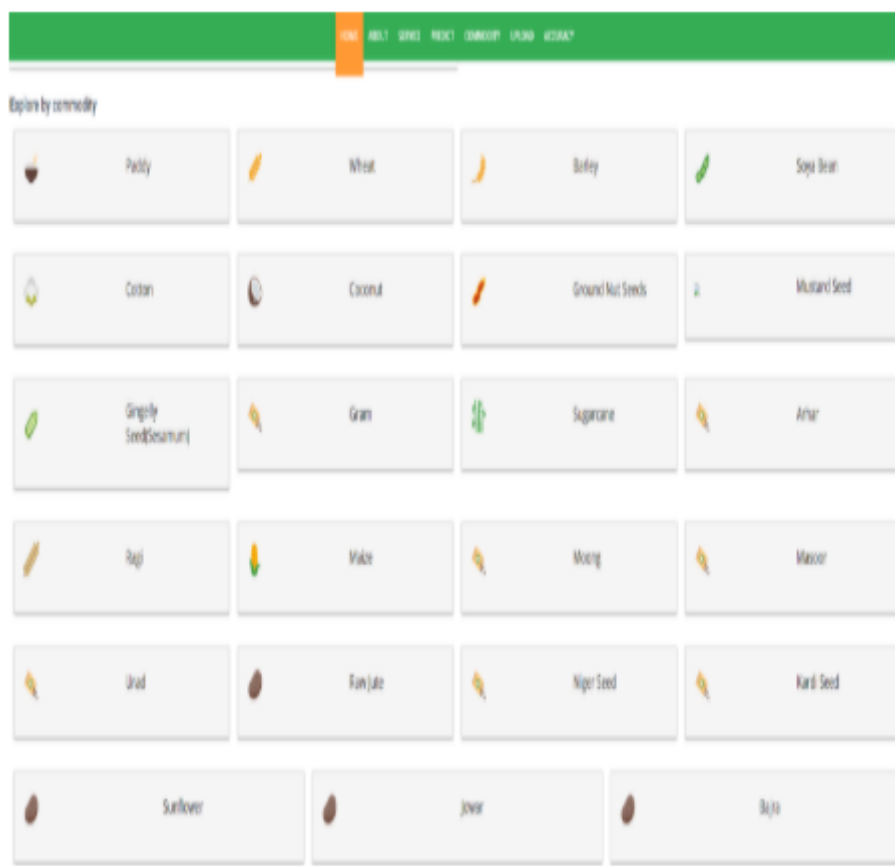

Fig 1: Working Model

CONCLUSION

The performance of our agricultural commodity price prediction model demonstrates promising results in forecasting the prices of key agri-horticultural commodities such as pulses, vegetables, and cereals. After

developing the model using Convolutional Neural Networks (CNNs), we evaluated its effectiveness in predicting price trends with high accuracy. The model's predictions showed a strong correlation with actual market prices, highlighting its ability to capture complex, nonlinear relationships within the data. The evaluation metrics, including Mean Absolute Error (MAE), Root Mean Squared Error (RMSE), R-squared (R^2), and Accuracy, indicate that the model performs effectively across different datasets. The precision of the model in forecasting price fluctuations is largely attributed to the CNN's capacity to automatically extract significant features from historical price data, weather conditions, and market trends. The comparative analysis with traditional models like ARIMA and machine learning models like LSTM showed that our CNN-based approach significantly outperforms them in terms of both accuracy and robustness. One of the key strengths of the model is its ability to generalize well, even when tested on unseen data. However, certain price patterns, especially those influenced by sudden market shocks or extreme weather events, were more challenging to predict accurately. This is reflected in the error analysis, where some fluctuations appeared in the residual plots and confusion matrices for classification-based outputs. These discrepancies highlight the potential areas where the model can be further improved. Our approach also addresses common challenges highlighted in the literature, such as the need for models that can handle multivariate inputs and large, dynamic datasets. By leveraging transfer learning and incorporating external factors like climate data, the model enhances its predictive performance, even when faced with limited historical data for specific commodities. The AI-ML-based price prediction model demonstrates the potential of machine learning to transform price forecasting in agriculture. By analyzing past data and integrating multiple factors like weather patterns and market trends, the model is able to provide precise and reliable price predictions for agricultural commodities. The system's ability to predict prices from 2025 to 2026 enables stakeholders to better plan for future pricing fluctuations. Additionally, the min/max price insights offered by the model help users make more informed decisions, potentially increasing profitability and reducing financial risks. The effectiveness of this model shows that machine learning can significantly improve price prediction accuracy, benefiting farmers, traders, and policy-makers involved in the agricultural sector.
